

## INTENSIVE VERSUS NON INTENSIVE ARABIC\*

By SAMI A. HANNA

### INTRODUCTION :

A recent trend in teaching foreign languages in the U.S., especially those declared critical, take the form of conducting an « intensive » course in the target languages. One usually hears nowadays that intensive language courses in the summer represent the wave of the present and future. The advocates of summer intensive language courses claim that they permit ready articulation with the work of the preceding and following years, particularly when the work is done at the same institution ; that constant, continuous exposure to the target language reduces the chances of lapses and forgetting ; that intensive courses make for quicker usefulness of a foreign language ; that the intensive courses assure attainment of the skills needed by elementary and high school teachers.

### *Purpose of the Study :*

The present study has been designed to investigate (1) the difference in achievement between a group of college students who studied a course in modern standard Arabic for one academic year and another group who studied the same course in a summer intensive program at the University of Utah ; and (2) whether or not there is a correlation between the student's language aptitude and his or her achievement score in the regular and intensive courses.

### *Subjects :*

The subjects in this study were twenty college students who registered in the beginning Arabic courses at the University of Utah, Salt Lake City.

The students who enrolled during the school year were nine. Five of these students had some Arabic background when they took the course. Eleven students enrolled in the intensive Arabic course in the summer at the same University.

\* The author is deeply indebted to Dr. ROBERT TRAVERS, Director of the Bureau of Educational Research, and to Dr. STAN MULAİK of the Department of Psychology at the University of Utah whose valuable assistance made this research paper possible.

Table I shows the major characteristics of the two groups.

TABLE I  
CHARACTERISTICS OF INTENSIVE AND NON-INTENSIVE STUDENTS

INTENSIVE		NON-INTENSIVE	
Case	MLAT Score	Case	MLAT Score

1) Approximate Percentile Rank estimated from norms for « students at the Army Language School », Table 3, Manual, *Modern Language Aptitude Test* (CARROLL and SAPON, 1959).

*Procedures :*

Each student in both groups was given the Modern Language Aptitude Test (2). The scores of all cases are shown in Table I.

These students were taught literary Arabic by one method. They covered one textbook, « An Elementary Manual of Contemporary Literary Arabic » by this writer. The text consists of twenty-six units, and each unit consists of a reading text, vocabulary list, questions on the reading material, grammar discussion and exercises. At the end of the instruction period (three quarters for the non-intensive group and eight weeks for the intensive), all the students were given the « First Year Arabic Qualifying Examination » by this writer. The test included 112 objective items and covered the following areas : vocabulary (synonyms, antonyms, definitions, and identifications), understanding of written Arabic, grammar, and oral comprehension.

*Limitations of Present Study :*

Although the reader will quickly perceive the more general and technical limitations of the present study, the writer feels it only fair to state as clearly as possible his views on some unique limitations in the present design.

1) A limitation this study shares with many other pieces of research done in this area is that the results were obtained upon a relatively small number of students. This introduces such serious limitations that any generalization will be hazardous.

2) The selection element of the students was not in the design of this study from its very onset. Due to the novelty of the language itself to a number of American colleges and universities, it is unlikely that one could find a hundred students or more enrolled in Arabic on one campus. Thus, the present writer acted on the assumption that a limited study in this area is better than no study at all.

3) A heterogenous group of students is being used in the present study. There is a wide range of language aptitude among the two groups, and no attempt was made to delineate the sample on the basis of MLAT scores or on any other variable.

4) Other limitations, such as measurements, statistical methods ; etc, will not be handled as separate problems.

*Result :*

For the intensive group (N = 11), total score on the achievement test ranged from 80 to 56, with a mean of 64.9. For the non-intensive group (N = 9), scores ranged from 97 to 55, with a mean of 78.4. (See Table II).

On the average, there is a slight superiority of the non-intensive group to the intensive group in the MLAT score. In interpreting the fact that the non-intensive group had a higher average score (78.4) on the final achievement test than the intensive group (which had an average score of 64.9), it could be argued that the difference would have been even greater if the groups had been better matched in number and other variables.

---

2) JOHN B. CARROLL and STANLEY M. SAPON. *Modern Language Aptitude Test*. New York, The Psychological Corporation, 1959.

In an effort to understand the role of aptitude as measured by the MLAT, scores of the achievement test have been plotted against scores of the MLAT, in Figure I, where it is evident that there is a rather high correlation between the MLAT as a predictor and the achievement test for combined groups ( $r = .76$ ).

A common charge in this regard is that the achievement test used in this experiment could have influenced the results. To avoid such a charge is to find some form of test as a valid measure. Such a test is not known to the writer.

#### SUMMARY :

This study attempts to find out if there is any difference between American students who study Arabic for one year and those who study the same course in eight weeks which is called « intensive ». It also attempts to find out whether or not there is a correlation between the student's language learning aptitude and his /her achievement in the regular and intensive course. The experiment was conducted at the University of Utah. The subjects of the experiment are American students who enrolled in the first year Arabic and students who took the same course in eight weeks only. Comparing the scores of each group it was found a slight superiority of the regular students. It was found that there is a high correlation between the Modern Language Aptitude Test (MLAT) and the achievement of the students in both groups.

#### الخلاصة

##### تعليم العربية المركز بالإضافة الى التعليم غير المركز

هذا البحث يرمى الى الاجابة على السؤال : هل هناك فرق بين الطلبة الامريكيين الذين يدرسون العربية لمدة عام دراسي كامل وهؤلاء الذين يدرسون نفس المنهج في ثمانية اسابيع ، وهو ما يسمى بالدراسة المركزة .

كما يحاول هذا البحث أيضا أن يجد أية علاقة نسبية (  $r$  ) بين قدرة الطالب في المجموعتين على تعليم لغة أجنبية ( العربية ) والدرجة التي يحصل عليها في النهاية .

هذه التجربة أجريت في جامعة يوتا وعناصرها تتكون من الطلبة الامريكيين الذين درسوا العربية للسنة الاولى والطلبة الذين درسوا نفس المناهج في ثمانية اسابيع .

وبمقارنة درجات كل مجموعة فقد وجد أن المجموعة التي تدرس عاما كاملا تتفوق قليلا على المجموعة التي تدرس في ثمانية اسابيع . كما وجد أيضا أن هناك علاقة نسبية عالية بين قدرة الطالب اللغوية — كما قيست باختبار (MLAT) ودرجة النهاية في الامتحان .

#### RESUME :

Rapport entre l'arabe intensif et non intensif.

Cette étude essaie de chercher s'il y a une différence entre des étudiants Américains qui ont eu une année d'Arabe et ceux qui ont suivi un cours accéléré dans la même langue. Elle essaie aussi de chercher s'il y a ou non une corrélation entre l'aptitude de l'étudiant à apprendre une langue et son résultat à la fin du programme normal ou du cours accéléré. L'expérience a été conduite à l'Université de l'Utah. Les sujets étaient des étudiants américains qui étaient inscrits en première année d'Arabe, et des étudiants qui ont reçu un cours accéléré de 8 semaines dans la même langue. En comparant les scores de chaque groupe, on a pu remarquer une légère supériorité du premier groupe, par rapport au second, c'est-à-dire, de ceux qui ont suivi le cours régulier, par rapport à ceux qui ont suivi le cours accéléré. La deuxième constatation, était une forte corrélation entre le « Modern Language Aptitude Test » (MLAT), et les résultats des étudiants des deux groupes.
